PLANING LOGIC

“Planning logic” means the structured way you think through a goal and decide what to do, in what order, and why. It’s used in project management, systems design, business processes, and even daily life decisions.

Here’s a clear and practical breakdown

1. Basic Planning Logic Flow

A simple logical sequence:

- Define Goal → 2. Identify Inputs → 3. Analyze Impact → 4. Decide Actions → 5. Execute → 6. Review

2. Core Components of Planning Logic

1. Goal Definition

- What are you trying to achieve?
- Example: “Improve system performance” or “Launch a product”

2. Input Identification

- What data/resources do you have?
- Examples
- Data sources
- People / team
- Tools / technology

3. Dependency Mapping

- What depends on what?
- Example: Task B starts only after Task A is completed

4. Impact Analysis

- If one thing changes, what happens?
- Example:
- Changing database → affects API → affects UI

5. Decision Logic

- Rules for making decisions:
- IF condition → THEN action

Example:

- IF delay > 2 days → escalate issue

6. Execution Plan

- Step-by-step tasks
- Timeline + responsibility

7. Monitoring & Feedback

- Track progress
- Adjust plan if needed
